

Transition Sumps

Petroleum Containment Transition Sumps can be used for a variety of different applications. The 48x36 models have an offset top that allows vertical entry of steel piping from above ground storage tanks to connect to underground fiberglass piping to remote dispensers.

TS363630-1

TS363612-1

Petroleum Containment 36x36 Transition Sumps are often used inline to serve as the system low-point for leak detection to reduce the number of leak detectors without adding additional fall to the overall piping run

The 36x36 transition sumps are also practical for marina applications where underground piping connects to a floating dock.
